TECHNICAL MEMORANDUM

DATE: **May 18, 2017**
TO: **William Paulitz, City Engineer, Peabody**
FROM: **Seth Asante and Katrina Crocker, MPO Staff**
RE: **Safety and Operations Analyses, FFY 2016**
Andover Street at Esquire Drive and Violet Road in Peabody

This memorandum summarizes the analyses and improvement alternatives developed for the intersection of Andover Street at Esquire Drive and Violet Road in Peabody. The opening sections of the memorandum give a background of the study and describe the existing conditions and concerns of the community. Following that, we describe the various kinds of data collected, and assess the safety and operational problems. The final sections of the memorandum present the improvement alternatives, recommendations, and next steps. This memo also includes appendices that contain methods and data applied in the study, detailed reports of the intersection capacity analyses, and an overview of the project development process.

1 BACKGROUND

The purpose of the Safety and Operations Analyses at Selected Intersections study is to examine safety, operations, and mobility issues at major intersections in the Boston Region Metropolitan Planning Organization (MPO) region's arterial highways—areas where many crashes occur, that experience congestion during peak traffic periods, or are in need of improvements for buses, bicyclists, and pedestrians. For the past ten years, the MPO has been conducting these planning studies, and municipalities in the region are very receptive to them. These studies give communities an opportunity to begin looking at the needs of these locations, starting at the conceptual level, before they commit funds for design and engineering. Eventually, if the project qualifies for federal funds, the study's documentation also is useful to the Massachusetts Department of Transportation (MassDOT). These studies support the MPO's visions and goals, which include increasing transportation safety, maintaining the transportation system, advancing mobility, and reducing congestion.

Following a selection process based on safety conditions[1], congested conditions[2], multimodal significance[3], regional significance[4], regional equity[5], and implementation potential[6], two locations from a short list of 20 intersections were approved for study by the MPO.[7] The two locations approved for study are:

1. Andover Street (Route 114) at Esquire Drive and Violet Road in Peabody
2. Broadway (Route 99) at Fourth Street, Fifth Street, and Hawthorne Street in Chelsea

The location in Peabody was selected because it has safety and traffic operations problems. This intersection is ranked 95 on the 2012–2014 Statewide Top-200 Intersection Crash List. Crashes at the intersection also form part of a Highway Safety Improvement Program (HSIP) crash cluster.[8] Figure 1 shows the location of the intersection and the surrounding roadways.

1.1 Public Participation

MPO staff discussed the safety and operations issues at the intersection and the scope of work for the study with the City of Peabody, which expressed interest and willingness to participate in the study. MassDOT—in collaboration with the City of Peabody, the Metropolitan Area Planning Council (MAPC), and the Central Transportation Planning Staff (CTPS) (to the Boston Region MPO)—conducted a road safety audit (RSA) for this intersection on Monday, November 21, 2016. Staff reviewed the recommendations of the RSA and incorporated them into this memorandum. (Appendix A includes information about the selection process and comments about the study.)

---

[1] Safety Conditions: Location has a higher-than-average crash rate for its functional class, contains a Highway Safety Improvement Program (HSIP)-eligible crash cluster, contains a top-200 high crash location, or has a significant number of pedestrian and bicycle crashes (two or more per mile).

[2] Congested Conditions: Travel time index is at least 1.3.

[3] Multimodal Significance: Location carries bus route(s), is adjacent to a transit stop or station; supports bicycle or pedestrian activities or has an implementation project to support one or more of these activities; has need to accommodate pedestrians and bicyclists and improve transit; or high truck traffic serving regional commerce.

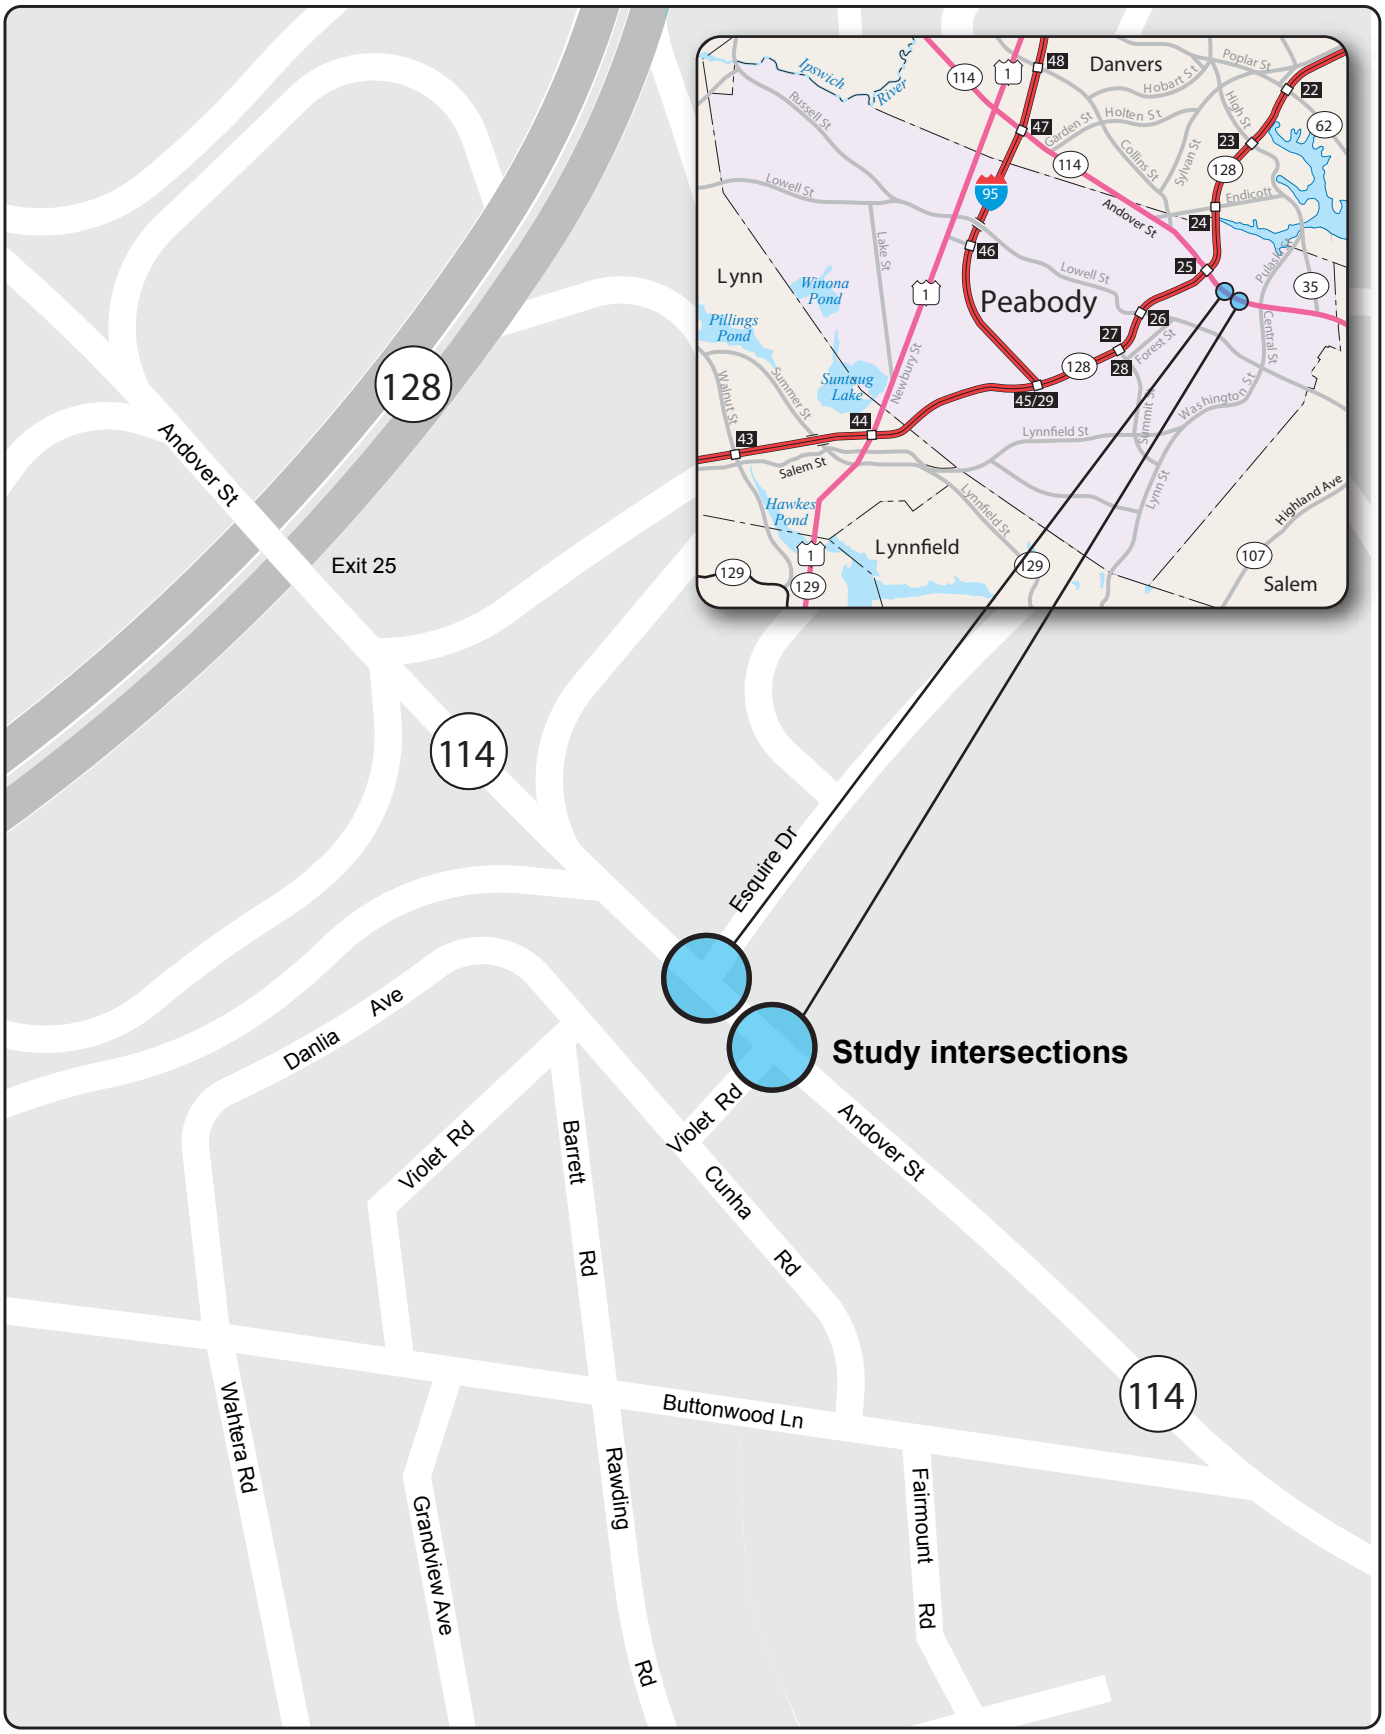
[4] Regional Significance: Location is in National Highway System; carries a significant portion of regional traffic (ADT >20,000); lies within 0.5 miles of EJ transportation analysis areas or zones; or is essential for the region's economic, cultural, or recreational development.

[5] Reginal Equity: That is, it was important not to select 1) more than one location in a subregion and 2) a location in same subregion as in the preceding cycle of this study.

[6] Implementation Potential: Location is proposed or endorsed by its roadway administrative agency (agencies); proposed or endorsed by its subregion and is a priority for that subregion; or has strong support from other stakeholders.

[7] Safety and Operations Analyses at Selected Intersections: Federal Fiscal Year 2016, Technical Memorandum to the Boston Region Metropolitan Planning Organization. Seth Asante and Katrina Crocker, March 17, 2016.

[8] In the Boston region, the 921 intersections in the top-five percent have crash clusters with a minimum equivalent property damage only value of 42.



BOSTON REGION MPO

Study Area Map

Safety and Operations Analyses at Selected Intersections

2 ROADWAY, INTERSECTIONS, AND LAND USES

2.1 Roadway

Andover Street (Route 114)

Andover Street provides access to and from several locations in Peabody as well as communities to the east and west, passing through Marblehead, Salem, Peabody, Danvers, Middleton, North Andover, and Lawrence. Although Andover Street is a state-numbered route, the segment beginning at and to the east of Esquire Drive and Violet Road is under the jurisdiction of the City of Peabody.

The roadway, functionally classified as a principal arterial, is part of the National Highway System (NHS) program and is eligible for federal funds under the program. Andover Street near the Esquire Drive and Violet Road intersection has right-of-way width that varies from 60 feet to 75 feet. To the east of the intersection, Andover Street is a two-lane, two-way arterial, with very wide travel lanes; during peak periods, drivers form two lanes in each direction although they are striped as single lanes. To the west of the intersection, Andover Street is a four-lane arterial, with two travel lanes in each direction. Near the intersection, there are continuous and connected sidewalks (six-to-eight feet wide) on both sides, and posted speed limits of 30 miles per hour eastbound and 35 mph westbound. On-street parking is prohibited in this segment and there are no shoulders, therefore bicyclists share the roadway with motor vehicles, but there are no sharrows lanes for sharing the roadway.

Esquire Drive

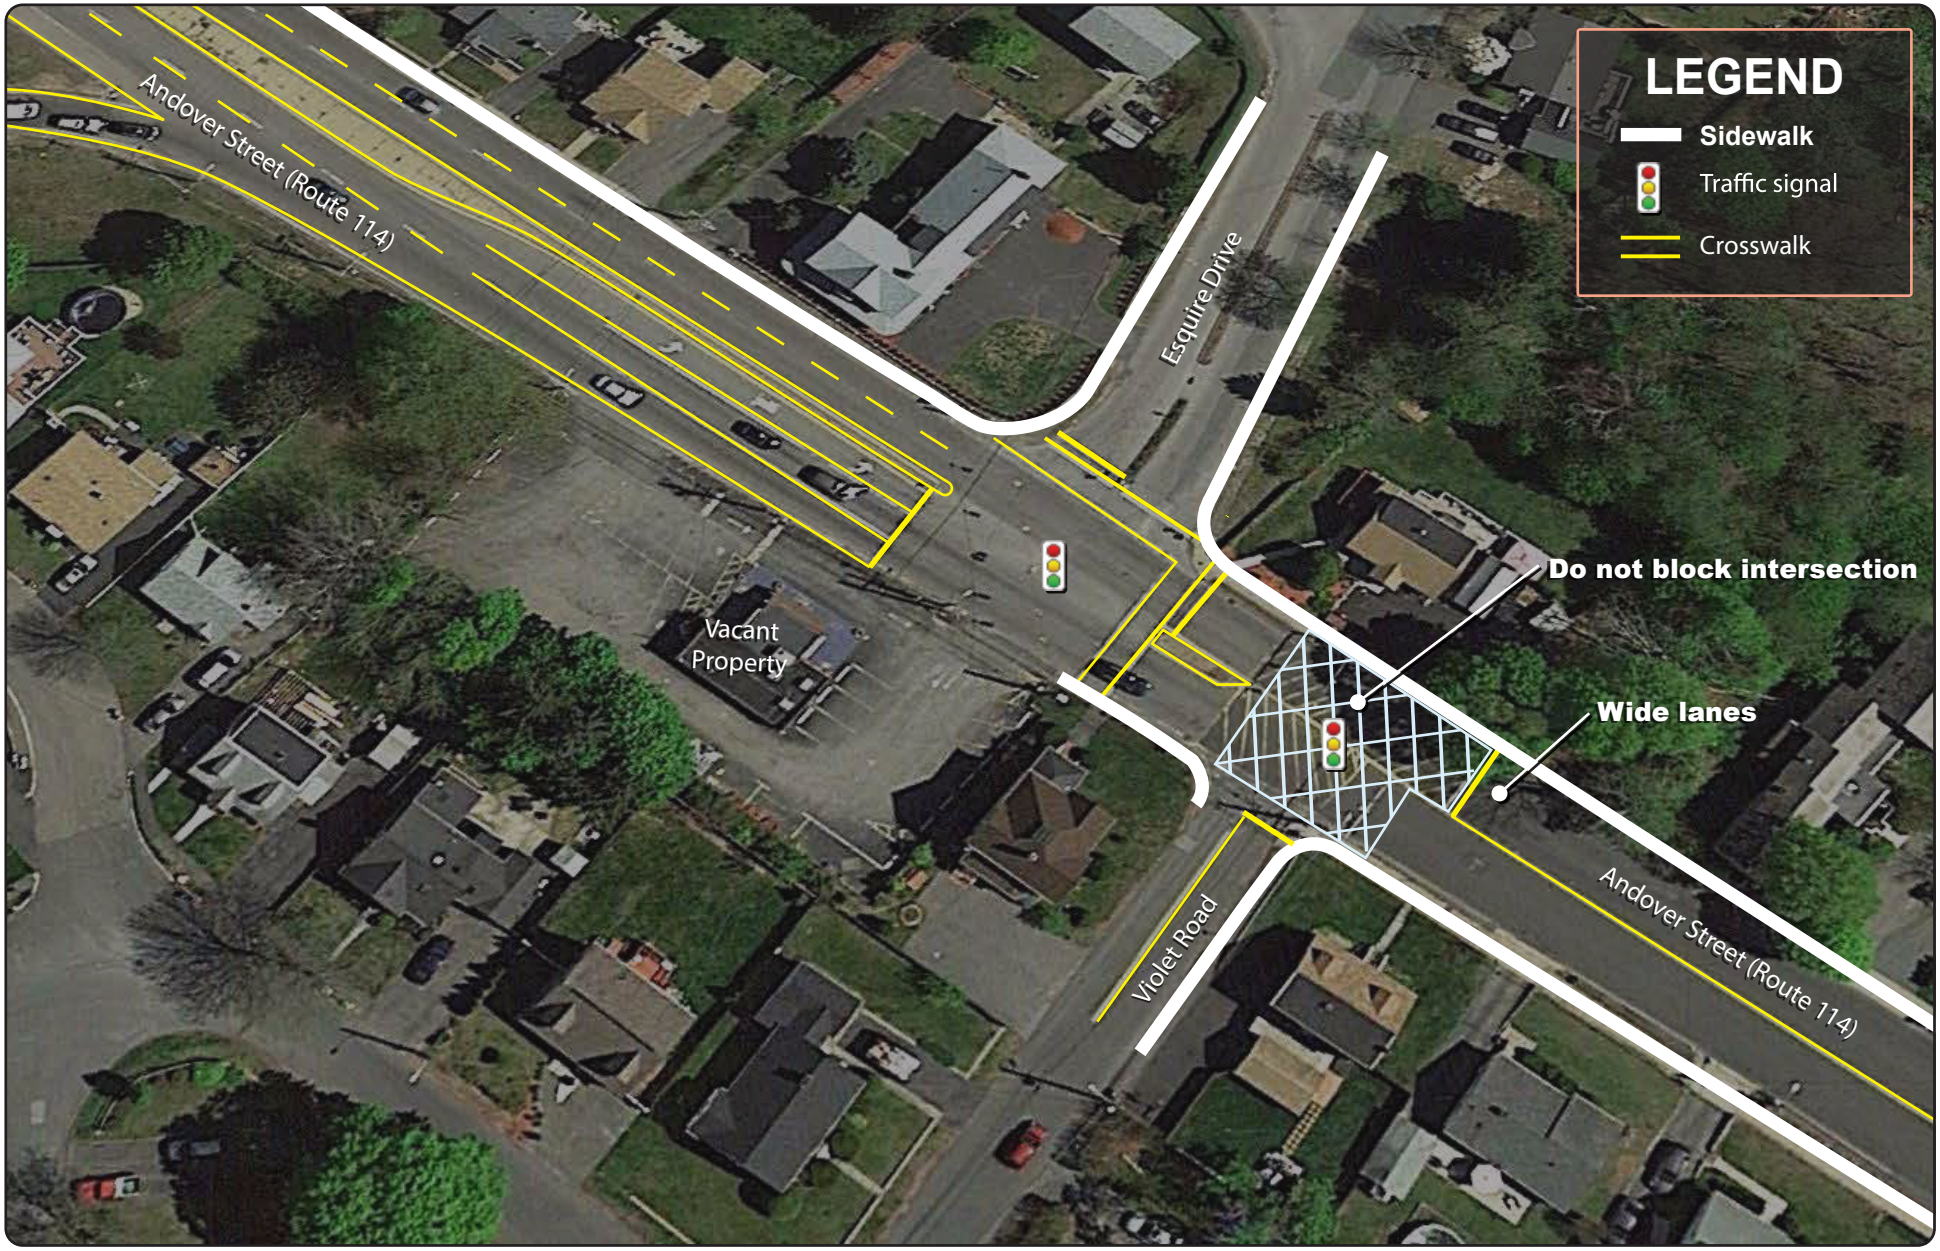
Esquire Drive is a city-owned two-lane, two-way local street providing access to a residential area north of the intersection. The right-of-way is approximately 60 feet wide and comprised of two wide travel lanes, a median, and sidewalks with grass buffers on both sides.

Violet Road

Violet Road is a city-owned two-lane, two-way local street providing access to a residential area south of the intersection. The right-of-way is approximately 30 feet wide and comprised of two 11-foot travel lanes and a sidewalk on the east side only.

2.2 Intersection

Figure 2 shows the study intersection layout, lane configurations, and the surrounding land uses.



BOSTON REGION MPO

N

Figure 2
Study Intersection Existing Conditions

Safety and Operations Analyses at Selected Intersections

As shown in Figure 2, Andover Street, Esquire Drive, Violet Road, and the driveways for Chandler's Ice Cream and a residential house on the opposite side of Violet Road intersect to form a complex signalized intersection. Traffic operation is complicated at the intersection because Violet Road is not directly aligned with Esquire Drive, which creates an offset intersection on Andover Street that put drivers in dilemma. Currently, the Chandler's Ice Cream property is vacant and there is no traffic into and out of that driveway.

The primary traffic flow is along Andover Street; Esquire Drive and Violet Road are low-volume residential streets. The eastbound approach on Andover Street widens to 33 feet at about 200 feet prior to the intersection, and it is striped as two through lanes and an exclusive left-turn lane. The westbound approach lane on Andover Street widens to 21 feet prior to the intersection and continues the same width through the intersection but it is striped as a single lane instead of two travel lanes. Each approach on Esquire Drive and Violet Road has one lane for all traffic movements.

The intersection is equipped with a fully actuated traffic signal but it lacks an Opticom system to handle emergency preemption. The signal heads are mounted on a mixture of span-wire, mast-arm, and post mounts but they lack backplates that would improve signal visibility. In addition, the eastbound Andover Street traffic has a leading protected left-turn phase but the left-turn signal head lacks left-turn arrow signals to communicate the information to the drivers turning left at that approach; this creates confusion as to whether the left turn is a ”protected” or “permitted” turn. Presently, the Andover Street eastbound left-turn signal head shows only circular green, yellow, and red indications.

There is functioning pedestrian signal with pushbuttons only for crossing Andover Street at Esquire Road. There is no crosswalk on Andover Street at the intersection of Violet Road. Some of the crosswalks lack curb ramps and those with curb ramps do not meet MassDOT's Americans with Disabilities Act (ADA) standards; they also lack detection-warning plates, and the cross slopes and landings are substandard. In addition, there is no accommodation for bicyclists at the intersection. The intersection curb radii are adequate for trucks and buses turning onto side streets but not adequate for making U-turns on Andover Street; hence, U-turns are prohibited on Andover Street.

The intersection has U-turn prohibition signs, banning eastbound U-turns on Andover Street and U-turns via Esquire Drive. The audit team observed that drivers do not comply with the U-turn prohibition signs on both Andover Street and Esquire Drive. The main reason for this noncompliance is that going east on Andover Street from the North Shore Mall and Route 128 interchange, it becomes very difficult for drivers to turn around if they find themselves headed

the wrong direction. Therefore, many drivers in this situation make the U-turn at the Andover Street and Esquire Drive intersection, which happens to be the first signalized intersection east of the Route 128 interchange. The two-hour AM and two-hour PM turning movement counts show six U-turn maneuvers on Andover Street eastbound at the intersection; however, the volume may be higher on a daily basis. In addition, the U-turn prohibition signs and obstructions in the median opening onto Esquire Drive are solutions to an existing U-turn problem.

The Massachusetts Bay Transportation Authority's (MBTA) Route 435 bus (Liberty Tree Mall to Central Square in Lynn via Peabody Square) and Route 465 bus (Salem Depot to Liberty Tree Mall via Peabody and Danvers) both stop near the study intersection, with service available on weekdays and on weekends. Route 435 operates Monday through Friday every 30 minutes from 6:40 AM to 11:20 PM; Saturday every 45 minutes from 6:45 AM to 11:43 PM; and Sunday every hour from 11:00 AM to 8:23 PM. Route 465 operates Monday through Friday every hour from 6:55 AM to 7:56 PM; Saturday every hour from 9:00 AM to 7:39 PM; and no Sunday service. The performance evaluation showed that MBTA bus Routes 435 and 465 failed the frequency-of-service and schedule-adherence standards; bus Route 465 had low ridership. The MBTA regularly evaluates performance of its services and recommends and implements service changes through the service planning process. The service planning process includes system-wide quarterly changes, ongoing rolling Service Plan changes, and an annual evaluation to inform the MBTA's budget process.

The land use near the study intersection is primarily residential.

3 DATA COLLECTION AND ANALYSIS

3.1 Data Source

MassDOT Highway Division's Traffic Data Collection Section collected turning-movement counts (TMCs) at the intersection in April 2016, while schools were in session. MassDOT conducted the counts during the weekday AM peak travel period (7:00 AM–9:00 AM), weekday PM peak travel period (4:00 PM–6:00 PM), and Saturday midday travel period (12:00 AM–2:00 PM). Heavy vehicles such as school buses, transit buses, and trucks were counted separately. Pedestrian and bicycle counts were conducted simultaneously with the TMCs. The division collected automatic traffic recorder (ATR) counts at two locations on Andover Street. ATR counts—which are continuous for a 48-hour period—are used to determine the average weekday traffic (AWDT) of a roadway. Finally, MassDOT collected spot speed data—which also are continuous 48-hour records—at the same two locations simultaneous with the ATR counts. (See Appendix B for traffic volume data, pedestrian and bicycle counts, and spot speed data.)

3.2 Vehicular Volumes and Distributions

Figure 3 shows the turning movement volumes at the intersection; and Table 1 presents a summary of ATR traffic data in terms of AWDT, peak hour volumes, and the directional distribution of the peak-hour traffic. Based on the counts, the estimated average daily traffic (ADT) and AWDT on Andover Street were 45,400 and 49,260 vehicles per day, respectively. The primary traffic flow on Andover Street is westbound during the AM peak period and eastbound during the PM peak period. During both AM and PM peak periods, the directional split on Andover Street is about 55 percent. The ADT on Esquire Drive and Violet Road were 2,700 and 1,000 vehicles per day, respectively.

Existing Turning Movement Volumes and Speeds

Safety and Operations Analyses at Selected Intersections

TABLE 1
Existing 2016 Traffic Volumes

Location	Average Weekday Volume [a]	AM Peak Hour Volume [b]	AM Peak Hour K-Factor [c]	Directional Distribution of Peak Hour Traffic [d]	PM Peak Hour Volume	PM Peak Hour K-Factor	Directional Distribution of Peak Hour Traffic
Andover Street, East of Violet Road	49,260	3,380	6.7	56% WB	3,710	7.5	54% EB
Esquire Drive, North of Andover St	2,650	170	6.4	71% SB	200	7.5	55% NB
Violet Road, South of Andover Street	1,010	65	6.4	62% NB	92	9.1	67% SB

a Daily traffic (both directions) expressed in vehicles per day. b Peak hour volumes (both directions) expressed in vehicles per hour. c Percent of daily traffic that occurs during the peak hour. d Directional distribution of peak hour traffic.
Source: Central Transportation Planning Staff.

The ATR and TMC counts show high traffic volumes on Andover Street during all three peak periods. Therefore, even though commuter volumes are the most critical factor and will drive the design, traffic congestion and delays also are present at the intersection on weekends because of shopping and other trips.

3.3 Pedestrians and Bicycles

Nineteen (19) pedestrians crossed at the intersection during the two-hour weekday AM and two-hour weekday PM peak periods, and another 19 pedestrians crossed during the two-hour Saturday PM peak period. No bicyclists used the intersection during the four-hour weekday and two-hour Saturday PM monitoring period.

3.4 Heavy Vehicles

The percentage of trucks driving through the intersection during the peak travel periods ranged between 3.0 and 4.0 percent, which is not considered high for peak-period traffic conditions.

3.5 Spot Speed

Analysis of the spot speed data, summarized in Figure 3, shows that the average speeds are lower than the posted speed limits; however, the 85th percentile speeds are consistent with posted speed limits—westbound traffic: 32 mph versus the 35 mph posted speed limit and eastbound traffic: 35 mph versus the 30 mph posted speed limit. Analysis of the spot speed data shows that eastbound vehicles travel at much higher speeds than do their westbound counterparts. At the time of data collection, about 41 percent of the westbound drivers were traveling between 19 and 29 mph (10 mph pace speed) and 60 percent of the eastbound drivers were traveling between 24 and 34 mph.

4 SAFETY CONDITIONS

4.1 Crash Summary

The intersection is ranked 95 on the 2012–2014 Statewide Top-200 Intersection Crash List. Crashes at the intersection form part of an HSIP crash cluster.[9] MassDOT defines HSIP-eligible crash clusters as those that rank within the top-five percent of crash clusters for each Regional Planning Agency, based on the equivalent property damage only (EDPO) index.[10] This HSIP crash cluster is comprised of 50 crashes, including ones near Violet Road, and has an EPDO of 118 crashes. CTPS reviewed the Peabody Police Department's 2013–2015 crash records that were used in the RSA. Below, we discuss crashes at the intersection in terms of severity, manner of collision, weather conditions, ambient light conditions, and time of occurrence (also summarized in Appendix C).

4.2 Crash Rate and Pattern

Using MassDOT Highway Division's methodology, CTPS calculated the intersection crash rates for the three-year period, 2013–2015. The average crash rate for the study intersection was 1.03 crashes per million entering vehicles, which exceeds the average crash rate for a signalized intersection in this district. The most recent statewide average crash rate for signalized intersections in MassDOT Highway Division District 4, which includes Peabody, is 0.73 crashes per million entering vehicles.[11] (See Appendix C for the crash rate worksheet.)

4.3 Collison Diagram

Collision diagrams are useful for examining crash patterns and developing safety strategies. Figure 4 shows the collision diagram prepared by MassDOT using the 2013–2015 crash data obtained from the Peabody Police Department. The numbers in the collision diagram uniquely identify each crash (and for further detail, may be used to cross reference the crash records in Appendix C). On the Andover Street approaches, the most prevalent crash pattern was the rear-end type, which typically are associated with congested signalized intersections.

[9] In the Boston region, the 921 intersections in the top-five percent have crash clusters with a minimum EDPO value of 42.

[10] EPDO Crash Rating = 10 * Fatal Crashes + 5 * Injury Crashes + 1 * Other Crashes (Property Damage Only or Unknown Severity), based on MassDOT top-200 high-crash locations: 2011-13 crash data.

[11] Based on MassDOT Registry of Motor Vehicles crash information queried on February 9, 2016.

BOSTON REGION MPO

Figure 4
Collision Diagram: Andover Street (Route 114) at Esquire Drive and Violet Road
Peabody Police Reports: January 2013–December 2015

Safety and Operations Analyses at Selected Intersections

The majority of the rear-end crashes on Andover Street resulted from following too closely, not paying attention, and taking an improper action. In addition, the most crashes occurred during the off-peak period between 8:00 AM and 4:00 PM and between 6:00PM and 12:00 AM. Another safety issue is lack of driver awareness and poor visibility of the signal heads that are blocked by overgrown vegetation and tree branches near the intersection. Lack of arrow indications for the eastbound Andover Street left turns and drivers forming two lanes at the Andover Street westbound approach during peak periods and single-lane traffic during off-peak periods further confuse drivers.

5 EXISTING TRAFFIC OPERATIONS CONDITIONS

Using the data and information collected, MPO staff built a traffic analysis network (with Synchro[12]) for the AM and PM peak periods to assess the capacity and quality of traffic flow at the intersections. Staff conducted the analyses consistent with Highway Capacity Manual (HCM) methodologies (detailed worksheets of the analyses are included in Appendix D).[13] The HCM methodology demonstrates the driving conditions at signalized and unsignalized intersections in terms of levels of service (LOS) ratings A through F. LOS A represents the best operating conditions (little to no delay), while LOS F represents the worst operating conditions (very long delay). LOS E represents operating conditions at capacity (limit of acceptable delay). Table 2 shows the control delays associated with each LOS for signalized and unsignalized intersections.

TABLE 2
Levels of Service and Control Delays at Intersections

Level of Service	Signalized Intersections Control Delay (seconds per vehicle)	Unsignalized Intersections Control Delay (seconds per vehicle)
A	≤ 10	≤ 10
B	> 10-20	> 10-15
C	> 20-35	> 15-25
D	> 35-55	> 25-35
E	> 55-80	> 35-50
F	> 80	> 50

[13] Highway Capacity Manual, HCM 2010, Volume 3: Interrupted Flow, Transportation Research Board of the National Academies, Washington DC, December 2010.

Table 3 presents peak-hour performance in terms of LOS, delay, and queues for existing conditions. Although, traffic operations at the intersection are satisfactory during the weekday AM and PM peak hours and Saturday PM peak hours (LOS D or better), there are traffic queues on Andover Street that extend eastward to Andover Drive and westward beyond the Andover Street ramp-arterial junction. The peak-hour LOS results are satisfactory because drivers form two travel lanes in each direction on Andover Street, which increases the intersection's capacity.

6 MAJOR PROBLEMS AND CONCERNS

Based on field reconnaissance, analysis of existing traffic conditions and crash data, and discussions from the RSA, MPO staff identified the following problems, some of which are depicted in Figure 5:

Pedestrian and Bicyclist Safety Issues

- Curb ramps not compliant with MassDOT ADA standards—creates problems for people using wheelchairs and strollers
- Crumbled sidewalks—creates poor walking conditions and problems for people with disabilities
- Lack of high-visibility crosswalks—to alert drivers to often-used pedestrian crossings
- Long crossing distance on east leg of Esquire Drive—increases likelihood of pedestrian-vehicle conflicts and crashes
- Lack of accommodation for bicyclists—increases likelihood of bicycle-vehicle conflicts and crashes

Intersection Safety Issues

- Intersection crash rate exceeds MassDOT District 4 average crash rate for signalized intersection—high-crash location
- Intersection ranks 95 on the 2012−2014 Top-200 Intersection Crash List—part of an HSIP crash cluster
- Widespread rear-end-type crashes on Andover Street approaches—type typically associated with congested signalized intersections

Traffic Operations Issues

- Outdated signal equipment—creates inefficient traffic operations; signal equipment not capable of adjusting timing of red, yellow, green lights to accommodate changing traffic patterns, and ease congestion
- Wide westbound approach lane on Andover Street—used as two lanes during peak travel periods and as single lane during off-peak travel periods; can confuse drivers
- Circular indications on Andover Street eastbound left-turn signal head—do not convey leading protected left-turn phase to drivers effectively
- Lack of Opticom receivers in signal equipment—cannot handle emergency preemption
- Lack of U-turn accommodation on Andover Street—forces drivers to use Esquire Drive to turn around
- Poor visibility of signal heads, blocked by overgrown vegetation and tree branches near intersection—contribute to crashes

Crumbled sidewalks

Lack of curb ramps

Gaps in sidewalk network

Signal heads lack backplates

Overgrown vegetation

Drivers form two lanes on Andover Street due to wide travel lanes

BOSTON REGION MPO

N

Figure 5
Examples of Problems Identified at the Intersection

Safety and Operations Analyses at Selected Intersections

7 FUTURE TRAFFIC GROWTH

Staff used a planning model to forecast future traffic-volume changes systematically that could result from changes in the transportation network or land use. The model used in this study is the MPO's most recently adopted regional travel demand model set used for the Long-Range Transportation Plan. Its socioeconomic components are based on forecasts produced by MAPC. Using TransCAD software, the model is calibrated at a regional level for 164 cities and towns, including all 101 cities and towns in the MPO region. Based on this regional planning model, traffic on Andover Street would grow at 0.4 percent per year, which results in total growth of five percent between 2016 and 2040.

8 IMPROVEMENT ALTERNATIVES

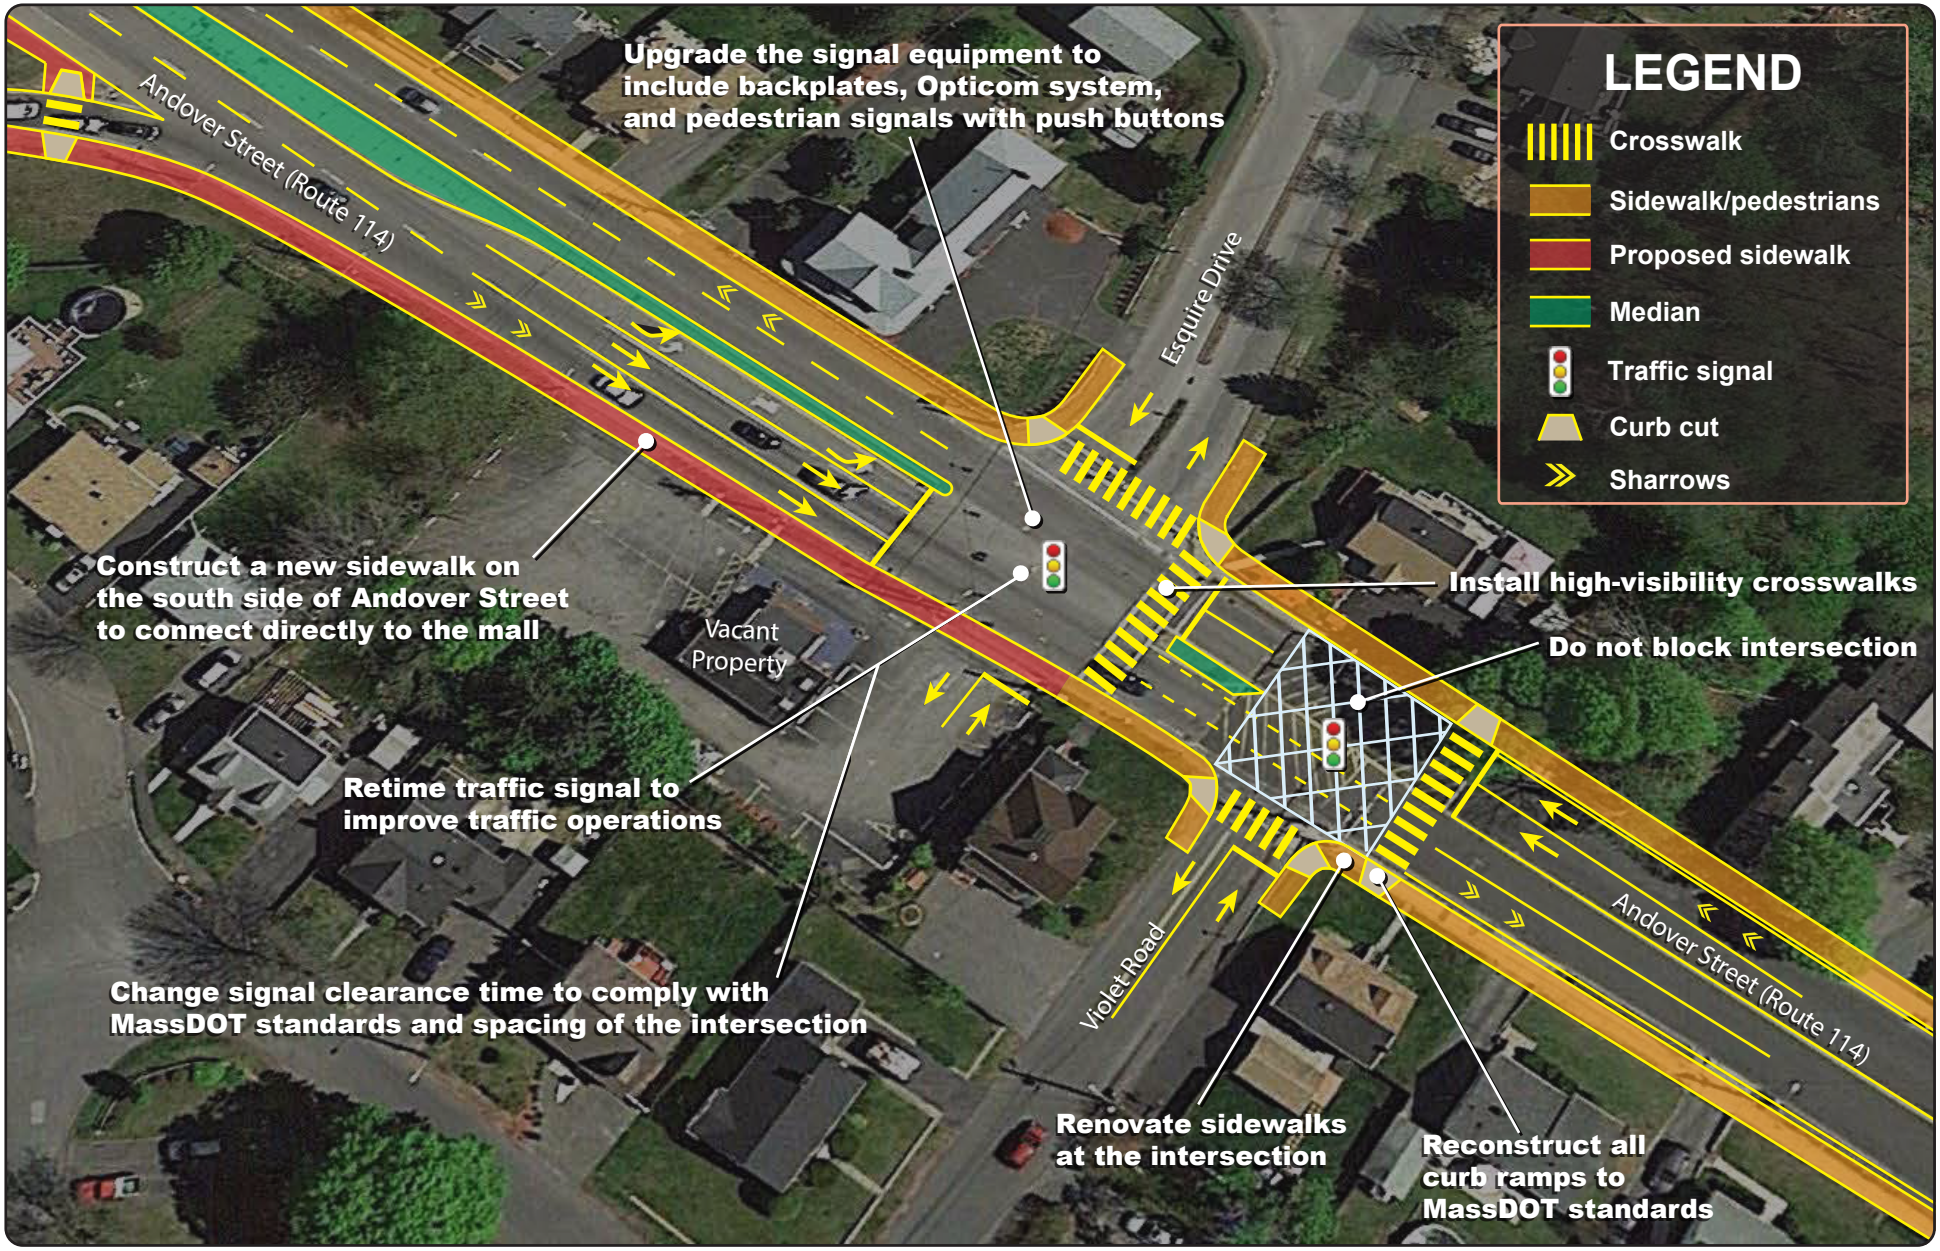
MPO staff developed and analyzed two alternatives to improve safety and traffic operations, which then were tested using 2040 future turning-movement volumes (Table 3).

8.1 Alternative 1: Renovate the Intersection (Figure 1)

Listed below are the specific safety and operations improvements in Alternative 1. These could be implemented in phases depending on the urgency of the problem, or they could be performed together in a reconstruction project. Based on reconstruction costs of similar projects recorded in MassDOT's project information database, CTPS estimates that the improvements would cost between $2 and $3 million.

Improvements to Increase Safety for Pedestrians

- Reconstruct curb ramps to comply with MassDOT's ADA standards—improve safety for people with disabilities and the elderly
- Upgrade sidewalks at the intersection—improve walking conditions
- Convert standard crosswalk markings to high-visibility markings (ladder type)—to ensure that they are visible to drivers and pedestrians
- Improve lighting—to increase safety and security for pedestrians; make drivers aware of the intersection, helping to reduce nighttime crashes
- Install pedestrian signals with pushbuttons—to make it easier for pedestrians to cross



BOSTON REGION MPO

N

Figure 6
Proposed Improvements
Alternative 1: Renovate the Intersection

Safety and Operations Analyses at Selected Intersections

Improvements to Increase Safety for Bicyclists

Presently, the existing right-of-way on Andover Street is very narrow, and it would not be possible to add bike lanes. In addition, the houses are already too close to the highway, which places further restrictions on widening Andover Street. Because of these limitations, CTPS suggests the following improvements:

- Install bicycle detectors and bicycle-detector pavement markings at the intersection—improve safety and reduce delays for bicyclists
- Provide shared-lane markings (sharrows) and bicycle signs on Andover Street—provide drivers with awareness of bicyclists

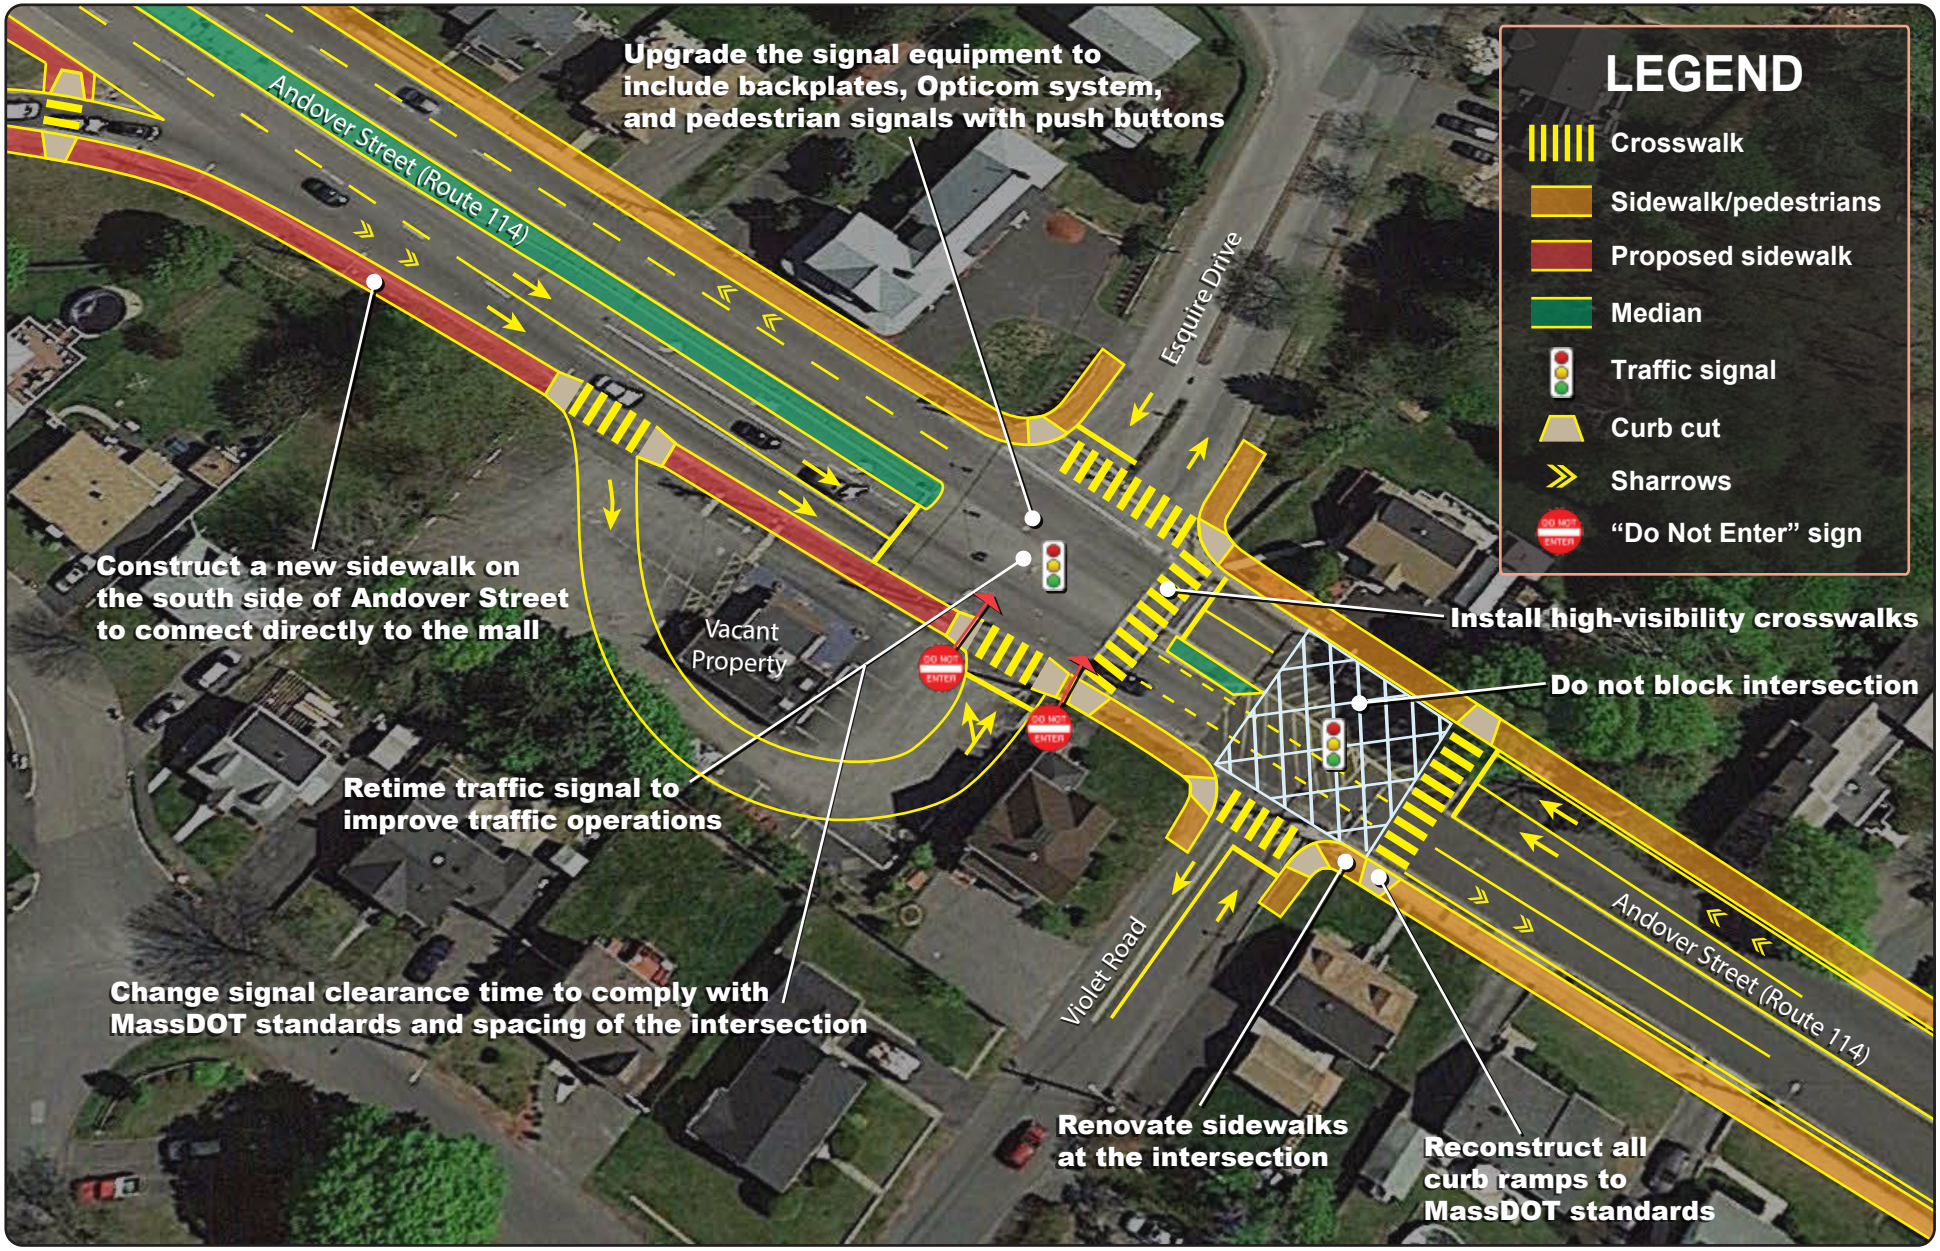
Improvements to Make Traffic Operations More Efficient

- Restripe travel lanes on Andover Street west of Violet Road into two travel lanes in each direction—to improve safety, streamline traffic operations, formalize current driver behavior
- Retime traffic signals with current traffic volumes provided by MassDOT—reduce delays and improve traffic operations
- Replace Andover Street eastbound left-turn circular signal head indications with arrow signal head indications—improve safety and better clarify protected left-turn movement for drivers
- Install intersection lane-control pavement marking — direct drivers through intersection, reduce confusion
- Update traffic signal equipment with 12-inch signal heads with retroreflective backplates to improve visibility of traffic signals. (Structural review of the signal poles, mast-arms, and span wires is needed to ensure they would be able to accommodate additional wind loads.)
- Add Opticom traffic receivers and strobes to signal equipment—to handle emergency preemption services
- Install advance traffic control signs such as the signal ahead (W3-3) sign on Andover Street—warn drivers in advance, and improve awareness of intersection and signal control
- Improve visibility of signal heads by removing overgrown vegetation and tree branches near intersection

8.2 Alternative 2: Jug Handle

Figure 7 shows the improvements in Alternative 2. This alternative was included in the analysis because it was one of the recommendations from the RSA, which included all of the safety and operational improvements in Alternative 1. The major differences between Alternative 2 and Alternative 1 are:

- Removal of the Andover Street eastbound left-turn lane
- Construction of new jug-handle turnaround to accommodate left-turns and U-turns at intersection



BOSTON REGION MPO

N

Figure 7
Proposed Improvements
Alternative 2: Redesign the Intersection to Include a Jug-Handle

Safety and Operations Analyses at Selected Intersections

Presently, there is no space in the northwest quadrant of the intersection to construct improvements that would allow U-turns on Andover Street. One recommendation from the RSA was to acquire the closed Chandlers Ice Cream Shop property to create a jug-handle turnaround there (analyzed in this alternative). The weekday peak period AM and PM turning movement counts show six U-turn maneuvers on Andover Street eastbound at the intersection. Also, the collision diagram did not indicate a crash involving a U-turn maneuver. Based on the reconstruction costs of similar past projects recorded in MassDOT's project information database, MPO staff estimate the improvements to cost between $3 and $4 million. This estimate does not include the land acquisition.

8.3 Level of Service for the Alternatives

No Build Alternative

The 2040 no-build analysis results presented in Table 3 show that traffic operations would deteriorate if no improvements are made at the intersection. Overall, traffic at the intersection would operate at LOS D, and Andover Street westbound would operate at LOS F because of congested conditions with a long traffic queue. In comparison, the 2016 existing conditions show the overall intersection at LOS C and Andover Street westbound at LOS D, but with a traffic queue.

Alternative 1

The analysis in Table 3 indicates that retiming the traffic signals would improve traffic operations. Overall, traffic at the intersection would operate satisfactorily at LOS B during the peak hours of travel, and Andover Street westbound would operate satisfactorily at LOS D, but with a traffic queue.

Alternative 2

The analysis in Table 3 also demonstrates that reconfiguring the intersection to include a jug-handle turnaround and retiming the traffic signals would produce similar LOS as in Alternative 1.

8.4 Advantages and Disadvantages of the Alternatives

No-Build Alternative

The no-build alternative would offer no benefits, and would exacerbate the existing problems at the intersection, such as:

- Increased congestion because of poor signal timing
- Worse traffic operations, resulting in long traffic queues that would extend onto the Route 128 ramps and Andover Street east of the intersection

- Decreased safety for road users, as no improvements would be constructed to prevent the numerous rear-end collisions
- Reduced safety for pedestrians because of lack of curb ramps or non-ADA-compliant curb ramps at crosswalk locations, and crumbled sidewalks
- Less safety for bicyclists by not providing bicycle-detector pavement markings, shared-lane markings (sharrows), and signs to increase drivers' awareness of bicyclists

Alternative 1

Alternative 1 would renovate the intersection to increase safety for motorists, pedestrians, and bicyclists and make traffic operations more efficient by:

- Addressing non- ADA-compliant issues for pedestrians by constructing curb ramps, sidewalks, and crosswalks to MassDOT standards
- Upgrading signal equipment to increase safety for motorists and make traffic flow efficient
- Retiming traffic signals to reduce rear-end crashes, congestion, and queues
- Constructing the improvements in Alternative 1 would not require land takings

The shortcomings of Alternative 1 are:

- Would not address U-turn maneuvers on Andover Street and Esquire Drive
- Might not be enough space on south side of the Andover Street Bridge over Route 128 to construct a minimum five-foot sidewalk leading to the North Shore Mall (a design exception may be required)
- Construction would affect traffic flow moderately, as improvements would necessitate traffic management during construction

Alternative 2

Alternative 2 has many of the benefits listed for Alternative 1, and would increase safety for motorists, pedestrians, and bicyclists and make traffic operations more efficient.

However, the jug-handle turnaround in Alternative 2 presents the following challenges and considerations:

- Would require land takings for the improvements
- Would send traffic very close to the houses on Violet Road; the traffic noise could be an issue
- Would cost significantly more than Alternative 1 because of land acquisition and construction costs

- Distance available for constructing a jug-handle turnaround might be too short (only 300 feet between the Route 128 northbound off-ramp-arterial junction and the intersection of Andover Street and Esquire Drive)
- Vehicles slowing down to turn onto jug-handle could have potential impact on eastbound traffic flow on Andover Street—especially Route 128 northbound heading east on Andover Street
- Peak-period traffic queues on eastbound approach of Andover Street could have impact on effectiveness of jug-handle turnaround; with potential to exacerbate the problem when pedestrian phase is activated and/or Esquire Drive and Violet Road split phases are running
- The jug-handle turnaround would affect pedestrians if the proposed sidewalk on south side Andover Street were implemented
- Construction would affect traffic significantly, as improvements necessitate traffic management during construction

Table 4 summarizes how each alternative would accomplish the goals and objectives of the study. The evaluation criteria are intended to provide qualitative and quantitative measures of the alternatives, providing insight into how the alternatives compare or relate to one another. The main goals and objectives are:

- Promotes healthy transportation
- Increases safety for all road users
- Makes traffic flow efficiently (reduces congestion)
- Creates a pedestrian- and bicyclist-friendly roadway
- Promotes land use and economic and cultural activities

TABLE 4
Summary of Alternatives

Goals and Objectives	No Build	Alternative 1	Alternative 2
Supports study goals and objectives	No benefit	Significant benefit	Significant benefit
Promotes healthy transportation	No benefit	Significant benefit	Significant benefit
Increases safety for all road users	No benefit	Significant benefit	Moderate benefit
Makes traffic flow efficiently	No benefit	Significant benefit	Moderate benefit
Promotes multimodal transportation	No benefit	Significant benefit	Significant benefit
Resolves U-turn maneuvers	No benefit	No benefit	Significant benefit
Avoids property impacts	Significant benefit	Significant benefit	No benefit
Minimizes construction impacts	Significant benefit	Significant benefit	Moderate benefit
Associated construct cost*	Low	Moderate	High

*Associated construction costs for those alternatives, which require an expansion of the right-of-way, as land takings would add to the total cost but are not accounted for in the study.
Source: Central Transportation Planning Staff.

9 CONCLUSIONS AND NEXT STEPS

9.1 Conclusions

The above analyses and evaluation supports the need for renovations that would improve safety and mobility for motorists, pedestrians, and bicyclists at the intersections of Andover Street and Esquire Drive and Violet Road. Alternatives 1 and 2 are capable of addressing many of the identified problems; but their shortcomings need to be considered before selecting a preferred alternative.

Deciding between the two alternatives hinges upon:

- The magnitude of the U-turn problem at the intersection and complaints from the neighborhood
- Whether there is enough space and distance to construct the jug-handle turnaround
- Whether the Chandlers Ice Cream property can be acquired
- Impacts of the jug-handle turnaround on traffic operations
- Impact of U-turns on safety and current traffic operations

In addition, selection of the preferred alternative should be based on cost and effectiveness; therefore, it is important for stakeholders to examine the alternatives with all road users in mind; participation in the selection process by other stakeholders is also important.

MPO staff recommend a total reconstruction of the intersection. However, depending on which alternative is selected, implementing some of the low-cost, short-term improvements, such as converting standard crosswalk markings to high-visibility markings, reconstructing curb ramps to ADA standards, and clarifying signal control would provide immediate benefits.

9.2 Next Steps

The City of Peabody has jurisdiction of the intersection and is responsible for renovations to improve safety, mobility, connectivity, and operations. This study gives the city an opportunity to look at the needs of the intersection and plan for design and engineering. The next step would be to select the preferred alternative that is sensitive to the goals and needs of stakeholders, and then advance the project through the planning process. The intersection is a high crash location and qualifies for HSIP funding. These steps will depend upon cooperation between MassDOT, the City of Peabody, and the MPO to begin the project notification and review process, and complete the project initiation form. After completing the initial steps, the City of Peabody and MassDOT can start preliminary design and engineering to place the project in the Transportation Improvement Program. Transportation decision making is complex, and

influenced by factors such as financial limitations and agency programmatic commitments. Project development is the process that takes transportation improvements from concept to construction (see Appendix E for an overview of this process).

This study supports the MPO's visions and goals, which include increasing transportation safety, maintaining the transportation system, advancing mobility and access, reducing congestion, and expanding the opportunities for walking and bicycling, while also making them safer. If implemented, the improvements proposed in this report would make traffic operations more efficient, while increasing safety and modernizing the roadway to accommodate all users.

To: Seth Asante
Subject: RE: Safety and Operations Analyses at Andover Street at Esquire Drive and Violet Road in Peabody

Hi Seth,

Thank you for the opportunity to review. I have the following comments:

- Note the absence of pavement markings for bicyclists for Andover Street in section 2.1 on p. 4 (i.e. no sharrow lanes for sharing the roadway)
- "Stripped" instead of "striped" in second paragraph on p. 6
- Given the alternatives and recommendations that are later discussed section 2.2 could use more detail on the U-turn's occurring on Andover St. and Esquire Dr. Do you have a degree of the volume that these are occurring? The degree to which these illegal movements are disrupting traffic volume and creating safety concerns would then justify an investment like the jug handle later proposed.
- Are service frequencies available for the Route 435 and 465 bus services on p. 7?
- Some of the data shown regarding speed readings in Figure 3 should be brought into the text of section 3.5 E.g. what 85th percentile speeds and 10 mph pace speeds say about traffic flow.
- Section 8.3 could use a comparison table. Any way to use graphics and/or tables to compare and contrast each of the alternatives is helpful.
- The jug handle conversation is throwing me off a bit. The last bullet on p. 21 notes that the distance available for constructing it appears too short. So why is it looked at as an alternative? Perhaps the language just needs to be softened – instead of "appears to" perhaps "may be"? But if your analysis shows that it's not feasible this should be considered before the alternative is developed further.
- Bulleted list in section 9.1 affirms previous points about the jug handle. The magnitude of the problem should have been further explored in the existing conditions. Space, distance, acquisition are factors you shouldn't be expected to explore here but impact of U-turns on current operations and potential improvements should be discussed further.

Let me know if you want to talk further.

Thanks,
Michael

Subject: Safety and Operations Analyses at Andover Street at Esquire Drive and Violet Road in Peabody

Hi Michael,

The preliminary draft technical memorandum for the *Safety and Operations Analyses at Andover Street at Esquire Drive and Violet Road in Peabody* is available for review and comment. The attached documents are the memo and appendices.
I will appreciate it if you can provide me with your comments by Friday, March 17. Feel free to contact me if you have any questions.

Thank you,
Seth

Subject: RE: Proposed MPO Study at the Intersection of Route 114/Andover Street and Esquire Drive

Hi Katrina,

I am happy to hear that the MPO is moving forward with Safety and Operations Study for Route 114/Andover Road at Esquire Drive and Violet Road.

How far back would you like for the police crash reports to go?

Thanks,

Subject: Proposed MPO Study at the Intersection of Route 114/Andover Street and Esquire Drive

Good afternoon Karen and William,

I'm pleased to announce that the Boston Region MPO staff has completed its evaluation of 20 location in the MPO region and selected Route 114/Andover Road at Esquire Drive and Violet Road in Peabody for the FFY 2016 Safety and Operations Study. (We also selected Broadway between Fourth Street and Fifth Street in Chelsea.) The selection was emailed to the Boston Region MPO members last week, and as no discussion occurred we are moving ahead with the study. The time frame is now through the end of September 2016.

In order to facilitate the study, we would like to begin our data collection and schedule an initial scoping meeting towards the end of April in Peabody to discuss study limits, tasks, and expectations. We are working with MassDOT Office of Transportation Planning to seek assistance for traffic count data collection. We have submitted an initial list of

count locations, attached. We will discuss this at the scoping meeting, and you are also welcome to provide input on this in the meantime if you like.

Before the scoping meeting, could you please send me police crash reports for crashes occurring at or near Route 114/Andover Road at Esquire Drive and Violet Road?

Thank you,
Katrina

Selection of Study Locations

TECHNICAL MEMORANDUM

DATE: **March 17, 2016**
TO: **Boston Region MPO**
FROM: **Seth Asante and Katrina Crocker**
RE: **Safety and Operations Analyses at Selected Intersections: Federal Fiscal Year 2016**

1 BACKGROUND

This memorandum presents the results of Task 1 of the work program for Safety and Operations Analyses at Selected Intersections: Federal Fiscal Year (FFY) 2016.[1] Task 1, Screen and Select Study Locations, includes a presentation of the results to the Boston Region Metropolitan Planning Organization (MPO) for discussion.

This study builds on recommendations generated by the MPO's Congestion Management Process (CMP) to address safety and congestion problems at intersections in the MPO area. Seven similar studies were completed in previous funding years and received favorable responses from municipalities—which appreciated the MPO's assistance with the conceptual design of low-cost improvements, and with the planning and implementation processes.

Previous studies examined large, complex intersections, simpler intersections, and locations that include two or more adjacent intersections. The focus for FFY 2016 is on simpler intersections. As in the past, the basic requirement for a location to qualify as a study candidate is that it must be located on an arterial roadway in the Boston Region MPO where: 1) many crashes occur, according to the Massachusetts Department of Transportation (MassDOT) crash database; 2) there is congestion during peak periods; and 3) the agencies and/or municipalities with jurisdiction over the roadway are committed to implementing recommended improvements.

A holistic approach to analyzing problems and forming recommendations would consider the needs of all public transportation users equally—whether they are walking, biking, using transit, or driving. Ultimately, this approach would result in

[1] Karl H. Quackenbush, CTPS Executive Director, memorandum of a work program to the Boston Region MPO, "Work Program for: Safety and Operations Analyses at Selected Intersections: FFY 2016," October 15, 2015.

intersections and roadways where it is safe to cross the street, walk or cycle to shops, schools, healthcare services, train stations, or recreational facilities, and where buses could run on time. Typically, the recommended improvements are within a roadway's right-of-way; and take into account the needs of abutters and users, and the interests and support of stakeholders.

2 SELECTION PROCEDURE

The study selection process consisted of four steps, in which MPO staff:

1) Generated a list of potential intersection study locations then narrowed it to 20 locations
2) Gathered detailed data for each of the 20 locations
3) Applied specific criteria to examine potential study locations more closely
4) Scored and rated the 20 locations, and assigned low, medium or high priority to each intersection location

2.1 Generating List of Potential Locations

MPO staff developed an initial list of 140 potential study locations in 44 municipalities in the MPO area, and used the following sources:

- FFY 2014 safety and operations list of potential candidates—the 15 intersections that were presented in the selection memorandum but not ultimately selected for study in FFY 2014
- MassDOT list of 2011–13 and 2010–12 statewide top-200 high-crash locations
- Locations suggested through Unified Planning Work Program outreach

Next, staff developed excluding criteria to reduce the list further. The location needed to be:

- In a municipality that has been selected for this study within the past three years
- In a subregion that has been well- or over-represented in past subregional priority corridor projects in terms of the proportion of population or MassDOT top-200 high-crash locations in the region
- Studied by MPO staff or another agency; included in a Transportation Improvement Program (TIP) project with a status of "advertised" or "programmed"; or included in an active MassDOT or other agency project that is in design (at 25 percent or higher design status), in construction, or recently completed
- Part of a larger potential study area, such as a highway interchange or a long traffic corridor with an extensive area of congestion

- Not at-grade

2.2 Gathering Detailed Data

Staff gathered data to support the excluding criteria and eliminated locations that were not suitable. Figure 1 was used to help determine which subregions were well- or over-represented by past safety and operations studies; it indicates where studies have occurred and overlays the MassDOT top-200 high-crash locations. Twenty locations passed the excluding criteria and were included in the final list.

The assembled data for 20 intersection locations in 14 municipalities in the MPO region are listed below.

- *MassDOT's 2014 Road Inventory File*. To collect the following information for each major arterial segment in each intersection location: roadway jurisdiction, National Highway System (NHS) status, and annual average daily traffic (AADT)
- *MassDOT's 2009–13 Crash Database*. Identify high-crash locations and numbers of crashes
- *MPO CMP Data on Arterial Congestion*. Determine travel time index (that is, travel time in the peak period divided by travel time in free-flow conditions) for each major arterial segment intersection location
- *MPO Data on Bike Network Gaps and MassDOT Bike Facilities:* Identify bicycle needs—including connectivity—and accommodation
- *Data on Massachusetts Bay Transportation Authority (MBTA) Bus Service Performance and Passenger Load*. Determine the percentage of bus trips that do not adhere to the schedule (late service) or to passenger load standards (crowding)
- *Data on MBTA Subway and Commuter Rail Lines*. Identify locations serving MBTA stations
- *Data on the Boston Region MPO's Environmental Justice (EJ) Zones*. Identify EJ areas
- *Also Included:*
    - Data selected from MassDOT's project-information and roadway safety audit databases
    - The MPO's 2016–20 TIP projects
    - MPO planning (and other) studies
    - Municipal websites (to obtain data on projects, studies, and TIP projects planned or programmed for each arterial segment)

Table 1 (at the end of this memorandum) presents the data assembled for each intersection location and cites: the municipality, Metropolitan Area Planning Council (MAPC) subregion, MassDOT district office, jurisdiction, equivalent property damage only crashes, total crashes, fatal crashes, injury crashes, property damage only and non-reported crashes, bicycle and pedestrian crashes, top-200 crash clusters, crash clusters that are eligible for Highway Safety Improvement Program (HSIP) funding, transit routes, a list of relevant studies or projects, and staff comments. It also shows the results of applying the selection criteria, as well as the priority rating, which was performed in the fourth step of this process (described below).

2.3 Applying Criteria

MPO staff further examined the intersection locations by applying the six criteria cited below (each item is worth one point):

- *Safety Conditions, 0–3 Points*
  - Location contains an HSIP-eligible crash cluster
  - Location is on MassDOT's top-200 high-crash locations list
  - Location has a significant number of pedestrian and bicycle crashes per year (more than three) or contains one or more HSIP-eligible bike-pedestrian clusters

- *Congested Conditions, 0–2 Points*
  - Travel time index is at least 1.30, or, in the absence of data, staff-estimated congested conditions
  - Travel time index is at least 1.50

- *Multimodal Significance, 0–3 Points*
  - Location currently supports transit, bicycle, or pedestrian activities
  - Location needs improved transit, bicycle, or pedestrian facilities
  - Location has a high volume of truck traffic serving regional commerce

- *Regional Significance, 0–4 Points*
  - Location is in the NHS
  - Location carries a significant portion of regional traffic (AADT is greater than 20,000 on at least one intersecting road)
  - Location lies within 0.5 miles of an EJ transportation analysis zone
  - Location is essential for the region's economic, cultural, or recreational development

- *Regional equity, 0–2 Points*

    - Location is in an MPO subregion that is at least slightly under-represented in previous safety and operations analyses in terms of the proportion of population or number of MassDOT top-200 high-crash locations in the region
    - Location is in an MPO subregion that is very under-represented in previous safety and operations analyses in terms of the proportion of population or number of MassDOT top-200 high-crash locations in the region

- *Implementation Potential, 0–3 Points*
    - Location has strong potential for implementation based on the urgent need for safety improvements
    - Location is proposed or endorsed by its roadway administrative agency or agencies
    - Location has strong support for improvements from other stakeholders (e.g., municipalities, MassDOT, and subregions)

In addition, no two locations in the same town would be selected.

2.4 Scoring and Rating

Intersection locations with a score of nine or fewer points were rated low priority; those with a score of 10-to-11 points were rated medium priority; and those with a score of 12 or more points were rated high priority. Staff chose these ranges so that roughly one-third of the locations would fall into each rating category. Five locations were given a high-priority rating and seven a medium-priority rating by MPO staff based on safety, operations, multimodal and regional significance, and support from agencies and municipalities. The availability of funding resources determined the number of segments selected.

Staff examined the high- and medium-priority segments more closely. Locations within the following parameters were not suitable candidates for this cycle of safety and operations analyses:

- Recently or currently under study
- Complexity of closely spaced intersections suggest that a corridor study is needed
- Selected for the FFY 2016 Subregional Priority Corridors study

3 SELECTED INTERSECTIONS FOR STUDY: BROADWAY AT FOURTH STREET AND FIFTH STREET IN CHELSEA; AND ROUTE 114/ANDOVER STREET AT ESQUIRE DRIVE AND VIOLET ROAD IN PEABODY

Based on the evaluation above, staff selected two intersections for study: 1) Broadway at Fourth Street and Fifth Street in Chelsea, and 2) Route 114/Andover Street at Esquire Drive and Violet Road in Peabody.

1) *Broadway at Fourth and Fifth Street in Chelsea*: The City of Chelsea asked MPO staff to study the intersections of Broadway at Fourth Street and Fifth Street because of safety concerns, as well as the potential effect of executing planned changes in its downtown area.

   This location is situated within a crash cluster that previously was ranked 141 on MassDOT's list of top-200 crash clusters for 2009−11, and is eligible for HSIP funding. During the five-year period 2009−13, 80 crashes were reported (16 per year), of which 24 resulted in non-fatal injuries. Nineteen crashes involving pedestrians and five crashes involving cyclists were reported.

2) *Route 114/Andover Street at Esquire Drive and Violet Road in Peabody*: The City of Peabody is very interested in addressing the large number of crashes at this location.

   These two adjacent signalized intersections on Route 114/Andover Street are located within a crash cluster that is ranked 130 on MassDOT's list of top-200 crash clusters for 2011–13. This cluster is eligible for HSIP funding. Fifty-six crashes were reported in the five-year period 2009−2013, 15 of which resulted in non-fatal injuries. Nearly three-quarters of the crashes were rear-ending.

4 SUMMARY

The recommended intersection locations meet the selection criteria of this study because of their potential for safety and operations improvements. The work scope for this study assumed that "as many as three" intersections would be selected. Staff selected two locations, each of which contains two intersections, for a total of four intersections.

Staff will submit these recommendations to the MPO for discussion. If the MPO endorses the study selections, staff will meet with officials from Chelsea,

Peabody, and MassDOT to discuss specifics of the study, conduct field visits, collect data, and perform analyses.

SA-KC/sa-kc

TABLE 1. FFY 2016 Safety and Operations for Selected Intersections
Selected locations are highlighted in green

Location	Community	MAPC Subregion	Jurisdiction	Street 1	Route 1	Street 2	EPDO Crashes 2011-13	Total Crashes 2011-13	Injury Crashes 2011-13	Bike/Ped Crashes 2011-13	Top-200 Crash Clusters 2011-13	HSIP-eligible Crash Clusters 2011-13	Transit Routes	TIP Status	Safety Conditions	Congested Conditions	Multimodal Significance	Regional Significance	Regional Equity	Implementation Potential	Total Score	Rating	Comments
1	Chelsea	ICC	City	Broadway		Fifth Street and Fourth Street	105	41	16	14	0	1	MBTA 111, 112, 114, 116, and 117	None	2	1	3	3	2	2	13	High	Potential candidate for a safety and operations study. It has a very high number of bicycle and pedestrian crashes. It is also a high-crash location and classified as a Highway Safety Improvement Program (HSIP)-eligible crash cluster. The City of Chelsea has expressed interest.
2	Boston	ICC	DCR	Jamaicaway		Bynner Street	106	46	15	2	1	1	None	None	2	1	2	4	2	2	13	High	Potential candidate for a safety and operations study. The location is in the current list of Top 200 High-Crash Intersections. The City of Boston expressed interest, but the Department of Conservation and Recreation (DCR) did not indicate interest.
3	Peabody	NSTF	MassDOT and City	Andover Street	Route 114	Esquire Drive	108	48	15	0	1	1	MBTA 435 and 465	None	2	2	2	4	1	2	13	High	Potential candidate for a safety and operations study. The location is in the current list of top-200 high-crash Intersections. The traffic signal is under City jurisdiction, although Route 114 is under MassDOT jurisdiction. Both the City of Peabody and MassDOT District 4 have indicated interest.
4	Chelsea	ICC	Town	Everett Avenue		Mystic Mall	184	108	19	12	1	1	MBTA 112,114	None	3	1	3	3	2	1	13	High	Although the location has high number of crashes and a very high number of bike and pedestrian crashes, it is not suitable for an intersection study because there are five closely spaced intersections including two signalized intersections and an at-grade railroad crossing that need to be evaluated together.
5	Newton	ICC	MassDOT and City	Washington Street	Route 16	South Entrance to Newton-Wellesley Hospital and Beacon Street	72	40	8	2	0	1	MWRTA Routes 1 and 8	None	2	1	2	3	2	2	12	High	Potential candidate for a safety and operations study. This location contains one HSIP-eligible crash cluster and a second cluster nearby would be included in the analysis.
6	Salem	NSTF	Town	North Street	Route 114	Mason Street	108	51	12	7	1	1	MBTA 465	None	3	0	2	4	1	1	11	Medium	This location was not selected because the crash cluster at this location includes two signalized intersections and four unsignalized intersections in a half-mile distance. An arterial segment study is more suitable for this location. In addition, a Route 1A study involving Swampscott, Salem, and Marblehead has been recommended for the MPO FFY 2016 Subregional Priority Corridors Study, and so, because of geographic equity considerations, this location is not recommended for that reason as well.
7	Watertown	ICC	DCR and Town	Galen Street	Route 16	Watertown Street	98	38	15	6	1	1	MBTA 52, 57, 59, 502, 504	None	3	0	2	3	2	1	11	Medium	Although the intersection has high number of bike and pedestrian crashes, it is too complex for a safety and operations study. It is vey close to the Galen Street bridge over the Charles River and Watertown Square, which pose overly difficult challenges as the right-of-way is constrained by buildings, the Charles River, and recreational space.
8	Milton	ICC, TRIC	MassDOT	Randolph Avenue	Route 28	Chickatawbut Road	157	57	25	0	1	1	BAT 12, MBTA 240	Pre-TIP (n.d.) Arterial and Intersection Project 607342	2	0	2	3	2	2	11	Medium	Potential candidate for a safety and operations study. MassDOT District 6 reports that the intersection is congested during commute hours. MassDOT has a project that has not advanced at Route 28/Chickataubaut; an intersection or corridor study would be helpful to address the safety and operations issues because of the high number of injury crashes.
9	Newton	ICC	City	Commonwealth Avenue	Route 30	Washington Street	55	23	8	2	0	1	MBTA 505	None	1	2	2	3	2	1	11	Medium	Potential candidate for a safety and operations analysis.
10	Marlborough	MetroWest	MassDOT	Boston Post Road West	Route 20	Northboro Road East (Shopping Plaza)	124	92	8	5	1	1	MWRTA Route 7	None	3	0	2	3	1	1	10	Medium	A Route 20 study in Marlborough is recommended for the MPO FFY 2016 Subregional Priority Corridors Study. This location was not selected because of the geographic equity consideration applied in the selection study locations.
11	Marlborough	MetroWest	MassDOT	East Main Street	Route 20	Curtis Avenue	220	184	9	2	1	1	MWRTA Route 7	None	2	0	2	4	1	1	10	Medium	This location is included as part of the proposed MPO FFY 2016 Subregional Priority Roadway Study on Route 20 in Marlborough. It has a high number of injury crashes and bike and pedestrian crashes.
12	Peabody	NSTF	MassDOT	Andover Street	Route 114	Northshore Mall	155	107	12	2	1	1	MBTA 435, 436, and 465; CATA Yellow Line	None	2	0	2	4	1	1	10	Medium	It appears that an arterial segment study would be more helpful to address safety and operations problems at four closely-spaced signalized intersections. A recent MassDOT resurfacing project does not appear to have addressed safety issues.
13	Danvers	NSTF	MassDOT	Andover Street	Route 114	Garden Street	98	38	15	1	1	1	None	None	2	0	2	3	1	1	9	Low	This intersection was studied as part of the FFY 2011 Priority Corridors: Route 114 Study in Danvers. That study proposed improvements for addressing safety and operations at the intersection.
14	Cambridge	ICC	DCR and City	Mount Auburn Street and Fresh Pond Parkway	Route 3	Coolidge Hill Road	33	17	4	1	0	0	MBTA 71 and 73	None	0	1	2	4	2	0	9	Low	Comments from MPO outreach indicate pedestrian safety issues and traffic congestion and operations concerns at Mount Auburn Street/Coolidge Hill Road. DCR interest is critical for this study due to the proximity of Route 3/Fresh Pond Parkway at Mount Auburn Street.
15	Boston	ICC	MassDOT	Columbia Road		Buttonwood Street	72	24	12	0	0	1	MBTA 8, 18, and 41	None	1	1	1	3	2	1	9	Low	Potential candidate for a safety and operations study. This unsignalized intersection is located between two busy and closely-spaced signalized intersections.
16	Boston	ICC	City	Dudley Street		Harrison Avenue	58	18	10	0	0	1	MBTA 15, 41, and 45	None	1	0	2	2	2	1	8	Low	This location needs to be analyzed together with several signalized intersections in the vicinity due to traffic circulation and queuing concerns. A subarea study would be more appropriate.
17	Wellesley, Newton	MetroWest, ICC	Town	Washington Street	Route 16	River Street	95	63	8	5	0	1	None	None	2	0	2	2	1	1	8	Low	Potential candidate for safety and operations analysis. A nearby bridge over the Charles River and a signalized intersection about 350 feet east of this intersection in Newton pose difficult challenges. Although the this intersection is in Wellesley, Newton's participation is critical.
18	Natick	MetroWest	Town	Speen Street		Cloverleaf Marketplace Shopping Center	127	79	12	1	1	1	MWRTA Route 9	None	2	0	1	2	1	1	7	Low	This location was studied by a consultant (VHB) for the Town of Natick. VHB proposed several improvements to address pedestrian and bicycle issues, as well as safety and operations problems.
19	Wrentham	SWAP	MassDOT	South Street	Route 1A	Premium Outlet Boulevard	171	99	18	1	1	1	None	None. Nearby Pre-TIP Major Highway Project 603739 does not include location	2	0	1	1	1	1	6	Low	Location is not suitable for an intersection study because it is close to the I-495 and Route 1A ramp-arterial junctions and would probably require signal coordination for four signalized intersections along the stretch. A recent MassDOT resurfacing project does not appear to have addressed safety issues.
20	Sherborn	SWAP	Town	Washington Street	Route 16	S Main Street (Route 27)	49	21	7	0	0	1	None	None	1	1	1	2	1	0	6	Low	Location was studied by CTPS and VHB in 2002 and 2004. Improvements were not implemented. A UPWP comment suggested that this could be a good location for demand response signal.

Source: Central Transportation Planning Staff.

Notes

1. Locations are in order of their ratings based on scoring from selection criteria.
2. EPDO Crash Rating = 10 * Fatal Crashes + 5 * Injury Crashes + 1 * Other Crashes (Property Damage Only or Unknown Severity), based on MassDOT top-200 high-crash locations: 2011-13 crash data.
3. HSIP-eligible crash clusters are defined by MassDOT as crash clusters that rank within the top five percent of crash clusters for each Regional Planning Agency, based on the EDPO index. In the Boston region the 921 intersections in the top five percent have crash clusters with a minimum EDPO value of 42

Selection Criteria

Safety Conditions: Intersection has a HSIP-eligible crash cluster, a top-200 high-crash location, and/or a significant number of or HSIP-eligible clusters of pedestrian or bicycle crashes.
Congested Conditions: Intersection experiences delays during peak periods.
Multimodal Significance: Intersection currently supports transit, bicycle or pedestrian activities, needs improved facilities for these activities, and/or has high truck traffic serving regional commerce.

Regional Significance: Intersection is on the National Highway System, carries a significant proportion of regional traffic, lies within 0.5 miles of Environmental Justice transportation analysis zones, and/or is essential for the region's economic, cultural, or recreational development.
Regional Equity: Intersection is underrepresented in previous safety and operations studies in terms of the proportion of population or number of top-200 high-crash locations.

Implementation Potential: Intersection has strong potential for implementation based on the urgent need for safety improvements, is proposed or endorsed by its roadway administrative agency or agencies, and/or has strong support from other stakeholders.

Acronyms and Abbreviations

BAT = Brockton Area Transit Authority. CATA = Cape Ann Transit Authority. CTPS = Central Transportation Planning Staff. DCR = Department of Conservation and Recreation. EJ = Environmental justice. EPDO = Equivalent property damage only. FFY = Federal fiscal year. HSIP = Highway Safety Improvement Program. ICC = Inner Core Committee. MAPC = Metropolitan Area Planning Council. MassDOT = Massachusetts Department of Transportation. MBTA = Massachusetts Bay Transportation Authority. MetroWest = MetroWest Regional Collaborative. MPO = Boston Region Metropolitan Planning Organization. MWRTA = MetroWest Regional Transit Authority. NSPC = North Suburban Planning Council. NSTF = North Shore Task Force. SWAP = South West Advisory Planning Committee. TIP = Transportation Improvement Program. TRIC = Three Rivers Interlocal Council. UPWP = Unified Planning Work Program.

Andover Street (Route 114) at Esquire Street, Peabody, MA

1/1/2013 - 12/31/2015

Crash Diagram Ref #	Crash Date	Crash Day	Time of Day	Manner of Collision	Light Condition	Weather Condition	Road Surface	Driver Contributing Code	Ages				Comments
	m/d/y			*Type*	*Type*	*Type*	*Type*	*Type*	*D1*	*D2*	*D3*	*D4*	
1	1/11/13	Friday	8:13 PM	Angle	Dark - lighted roadway	Rain	Wet	Failed to yield right of way	22	20			MV1 TRAVELLING STRAIGHT, EB, ON ANDOVER STREET WHEN MV2 MADE LEFT TURN, SB, ONTO VIOLET ROAD. MV2 FAILED TO YIELD RIGHT OF WAY.
2	3/5/13	Tuesday	8:31 PM	Angle	Dark - lighted roadway	Cloudy	Dry	Operating Vehicle in erratic, reckless, careless, negligent, or aggressive manner	23	20			MV1 EB ON ANDOVER AND RAN TWO CONSECUTIVE RED LIGHTS. MV2 WAS NB OUT OF VIOLET WITH GREEN LIGHT. MV1 HITS MV2.
3	3/8/13	Friday	11:54 AM	Rear-end	Daylight	Snow	Snow	Swerving or avoiding due to wind, slippery surface, vehicle, object, non-motorist in roadway, etc.	41	25			MV1 WB ON ANDOVER ST. MV2 STOPPED AT RED LIGHT AT ESQUIRE, MV1 COULDN'T STOP PROPERLY DUE TO SNOW, REAR-ENDED MV2.
4	5/23/13	Thursday	5:46 PM	Rear-end	Daylight	Clear	Dry	Inattention	65	23			NO NARRATIVE
5	8/6/13	Tuesday	10:33 AM	Rear-end	Daylight	Clear	Dry	Unknown	79	25	22		MV1 STOPPED AT SIGNAL, MV2 WAS BEHIND MV1 CHANGING INTO LEFT LANE. MV3 REAR-ENDED BOTH MV1 AND MV2. MV3 CLAIMS MV2 CHANGED LANES DIRECTLY IN FRONT OF MV3.
6	8/9/13	Friday	3:51 PM	Sideswipe, same direction	Daylight	Cloudy	Wet	Distracted	50	59			MV1 AND MV2 WB ON ANDOVER ST. UNK MV TURNING LEFT ONTO VIOLET. MV2 ATTEMPTED LANE CHANGE AND COLLIDED WITH MV1.
7	9/3/13	Tuesday	8:06 AM	Rear-end	Daylight	Clear	Dry	Followed too closely	54	47			MV1 AND MV2 EB ON ANDOVER ST. SECOND SIGNAL TURNED RED AND MV2 DID NOT REALIZE MV1 STOPPED AT LIGHT, REAR-ENDING MV1.
8	9/9/13	Monday	7:23 PM	Rear-end	Dark - lighted roadway	Cloudy	Dry	Followed too closely	22	49			MV1 AND MV2 WB ON ANDOVER ST. MV1 REAR-ENDED BY MV2 WHEN SIGNAL WAS TURNING RED.
9	9/27/13	Friday	12:40 PM	Rear-end	Daylight	Cloudy	Dry	Swerving or avoiding due to wind, slippery surface, vehicle, object, non-motorist in roadway, etc.	30	24			MV1 AND MV2 WB ON ANDOVER ST. MV2 WAS REAR-ENDED BY MV1. BUS CUT OFF MV2 CAUSING SUDDEN HALT.
10	10/4/13	Friday	12:17 PM	Rear-end	Daylight	Rain	Wet	Followed too closely	19	28			MV1 STOPPED AT SIGNAL. MV2 REAR-ENDED MV1, CLAIMS DIDN'T SEE MV1 STOPPED.
11	10/19/13	Saturday	12:11 PM	Sideswipe, same direction	Daylight	Clear	Dry	Failure to keep in proper lane or running off road	43	63			MV1 AND MV2 WB ON ANDOVER ST. MV2 ATTEMPTED TO CHANGE LANES BUT DID NOT NOTICE MV1 IN DESIRED LANE.
12	11/1/13	Friday	7:37 AM	Sideswipe, same direction	Daylight	Clear	Dry	Other improper action	19	44	60		MV1 AND MV2 WB ON ANDOVER ST. MV3 PULLED OUT FROM ESQUIRE INTO MV2'S LANE. MV2 SWERVED TO AVOID MV3 BUT HIT MV1.
13	11/4/13	Monday	7:15 PM	Angle	Dark - lighted roadway	Cloudy	Dry	Other improper action	56	34			MV1 EB ON ANDOVER, FAILED TO STOP FOR RED SIGNAL. MV2 NB FROM VIOLET WITH GREEN, WAS STRUCK BY MV1.
14	11/7/13	Thursday	12:37 PM	Rear-end	Daylight	Rain	Wet	Unknown	29	56			MV1 AND MV2 WB ON ANDOVER ST. MV1SPED UP TO MAKE FIRST LIGHT THEN STOP AT SECOND LIGHT. MV2, FOLLOWING MV1, BELIEVED MV1 WAS GOING THROUGH BOTH LIGHTS, REAR-ENDED MV1.
15	11/13/13	Wednesday	7:38 AM	Sideswipe, same direction	Daylight	Clear	Dry	Swerving or avoiding due to wind, slippery surface, vehicle, object, non-motorist in roadway, etc.	36	47			MV1 WB SWERVED TO AVOID A COLLISION, HIT MV2 IN NEXT LANE, THEN COLLIDED WITH MV2 IN REAR. MV1 CLAIMS TRYING TO AVOID UNKNOWN VEHICLE.
16	11/18/13	Monday	8:47 AM	Rear-end	Daylight	Cloudy	Wet	Followed too closely	42	24			MV1 AND MV2 WB ON ANDOVER ST. UNKNOWN MV STOPPED SUDDENLY IN FRONT OF MVS. MV2 COULD NOT REACT IN TIME, REAR-ENDED MV1.
17	12/28/13	Saturday	10:19 PM	Rear-end	Dark - lighted roadway	Clear	Dry	Followed too closely	50	21			MV1 AND MV2 EB ON ANDOVER ST. MV1 STOPPED AT RED SIGNAL, MV2 REAR-ENDED MV1.
18	3/21/14	Friday	9:30 PM	Rear-end	Dark - lighted roadway	Cloudy	Dry	Followed too closely	17	26			MV1 AND MV2 WB ON ANDOVER ST, MV1 FAILED TO STOP BEHIND MV2, WHO WAS STOPPED AT RED SIGNAL.
19	3/23/14	Sunday	6:54 PM	Rear-end	Dusk	Clear	Sand, mud, dirt, oil, gravel	Inattention	37	26			MV1 AND MV2 STOPPED AT SIGNAL IN FRONT OF VIOLET, WB. SIGNAL IN FRONT OF ESQUIRE TURNED GREEN AND MV2 BEGAN TO MOVE BUT MV1 DID NOT CAUSING MV2 TO REAR-END MV1.
20	3/26/14	Wednesday	1:11 PM	Rear-end	Daylight	Clear	Dry	No Improper Driving	64	30	45		MV1, MV2 AND MV3 WB ON ANDOVER BEFORE ESQUIRE. MV1 AND MV2 STOPPED FOR RED SIGNAL. MV3 REAR-ENDED MV2 CAUSING CHAIN REACTION.
21	4/23/14	Wednesday	3:00 PM	Rear-end	Daylight	Clear	Dry	Followed too closely	24	57			MV1 AND MV2 WB ON ANDOVER AT VIOLET. MV2 STOPPED DUE TO RED SIGNAL, MV1 COULD NOT STOP IN TIME, REAR-ENDED MV2.
22	5/16/14	Friday	10:39 PM	Rear-end	Dark - lighted roadway	Rain	Wet	Inattention	32	59			MV1 STOPPED AT FIRST SET OF LIGHTS WHEN MV2 REAR-ENDED MV1. WB ACROSS FROM VIOLET.
23	5/16/14	Friday	10:53 PM	Angle	Dark - lighted roadway	Clear	Dry	Over-correcting/over-steering	46	24			MV2 MADE LEFT TURN ONTO ESQUIRE, SIDESWIPING A PARKED MV1.
24	5/28/14	Wednesday	3:08 PM	Rear-end	Daylight	Rain	Wet	Followed too closely	37	73			MV1 AND MV2 WB AT ESQUIRE SIGNAL. MV1 STOPPED SHORT, CAUSING MV2 TO REAR-END MV1.

Appendix E: MassDOT Highway Division's Project Development Process

Overview of the Project Development Process

Transportation decision-making is complex and can be influenced by legislative mandates, environmental regulations, financial limitations, agency programmatic commitments, and partnering opportunities. Decision-makers and reviewing agencies, when consulted early and often throughout the project development process, can ensure that all participants understand the potential impact these factors can have on project implementation. Project development is the process that takes a transportation improvement from concept through construction.

The MassDOT Highway Division has developed a comprehensive project development process which is contained in Chapter 2 of the *MassDOT Highway Division's Project Development and Design Guide*. The eight-step process covers a range of activities extending from identification of a project need, through completion of a set of finished contract plans, to construction of the project. The sequence of decisions made through the project development process progressively narrows the project focus and, ultimately, leads to a project that addresses the identified needs. The descriptions provided below are focused on the process for a highway project, but the same basic process will need to be followed for non-highway projects as well.

1. Needs Identification

For each of the locations at which an improvement is to be implemented, MassDOT leads an effort to define the problem, establishes project goals and objectives, and defines the scope of the planning needed for implementation. To that end, it has to complete a Project Need Form (PNF), which states in general terms the deficiencies or needs related to the transportation facility or location. The PNF documents the problems and explains why corrective action is needed. For this study, the information defining the need for the project will be drawn primarily, perhaps exclusively, from the present report. Also, at this point in the process, MassDOT meets with potential participants, such as the Metropolitan Planning Organization (MPO) and community members, to allow for an informal review of the project.

The PNF is reviewed by the MassDOT Highway Division district office whose jurisdiction includes the location of the proposed project. MassDOT also sends the PNF to the MPO, for informational purposes. The outcome of this step determines whether the project requires further planning, whether it is already well supported by prior planning studies, and, therefore, whether it is ready to move forward into the design phase, or whether it should be dismissed from further consideration.

2. Planning

This phase will likely not be required for the implementation of the improvements proposed in this planning study, as this planning report should constitute the outcome of this step. However, in general, the purpose of this implementation step is for the project proponent to identify issues, impacts, and approvals that may need to be obtained, so that the subsequent design and permitting processes are understood.

The level of planning needed will vary widely, based on the complexity of the project. Typical tasks include: define the existing context, confirm project need, establish goals and objectives, initiate public outreach, define the project, collect data, develop and analyze alternatives, make recommendations, and provide documentation. Likely outcomes include consensus on the project definition to enable it to move forward into environmental documentation (if needed) and design, or a recommendation to delay the project or dismiss it from further consideration.

3. Project Initiation

At this point in the process, the proponent, MassDOT Highway Division, fills out a Project Initiation Form (PIF) for each improvement, which is reviewed by its Project Review Committee (PRC) and the MPO. The PRC is composed of the Chief Engineer, each District Highway Director, and representatives of the Project Management, Environmental, Planning, Right-of-Way, Traffic, and Bridge departments, and the MassDOT Federal Aid Program Office (FAPO). The PIF documents the project type and description, summarizes the project planning process, identifies likely funding and project management responsibility, and defines a plan for interagency and public participation. First the PRC reviews and evaluates the proposed project based on the MassDOT's statewide priorities and criteria. If the result is positive, MassDOT Highway Division moves the project forward to the design phase, and to programming review by the MPO. The PRC may provide a Project Management Plan to define roles and responsibilities for subsequent steps. The MPO review includes project evaluation based on the MPO's regional priorities and criteria. The MPO may assign project evaluation criteria score, a Transportation Improvement Program (TIP) year, a tentative project category, and a tentative funding category.

4. Environmental Permitting, Design, and Right-of-Way Process

This step has four distinct but closely integrated elements: public outreach, environmental documentation and permitting (if required), design, and right-of-way acquisition (if required). The outcome of this step is a fully designed and permitted project ready for construction. However, a project does not have to be fully designed in order for the MPO to program it in the TIP. The sections below provide more detailed information on the four elements of this step of the project development process.

Public Outreach

Continued public outreach in the design and environmental process is essential to maintain public support for the project and to seek meaningful input on the design elements. The public outreach is often in the form of required public hearings, but can also include less formal dialogues with those interested in and affected by a proposed project.

Environmental Documentation and Permitting

The project proponent, in coordination with the Environmental Services section of the MassDOT Highway Division, will be responsible for identifying and complying with all applicable federal, state, and local environmental laws and requirements. This includes determining the appropriate project category for both the Massachusetts Environmental Protection Act (MEPA) and the National Environmental Protection Act (NEPA). Environmental documentation and permitting is often completed in conjunction with the **Preliminary Design** phase described below.

Design

There are three major phases of design. The first is **Preliminary Design**, which is also referred to as the 25-percent submission. The major components of this phase include full survey of the project area, preparation of base plans, development of basic geometric layout, development of preliminary cost estimates, and submission of a functional design report. Preliminary Design, although not required to, is often completed in conjunction with the Environmental Documentation and Permitting. The next phase is **Final Design**, which is also referred to as the 75-percent and 100-percent submission. The major components of this phase include preparation of a subsurface exploratory plan (if required), coordination of utility relocations, development of traffic management plans through construction zones, development of final cost estimates, and refinement and finalization of the construction plans. Once Final Design is complete, a full set of **Plans, Specifications, and Estimates (PS&E)** is developed for the project.

Right-of-Way Acquisition
A separate set of Right-of-Way plans are required for any project that requires land acquisition or easements. The plans must identify the existing and proposed layout lines, easements, property lines, names of property owners, and the dimensions and areas of estimated takings and easements.

5. Programming (Identification of Funding)
Programming, which typically begins during the design phase, can actually occur at any time during the process, from planning to design. In this step, which is distinct from project initiation, the proponent requests that the MPO place the project in the region's Transportation Improvement Program (TIP). The proponent requesting the project's listing on the TIP can be the community or it can be one of the MPO member agencies (the Regional Planning Agency, MassDOT, and the Regional Transit Authority). The MPO then considers the project in terms of state and regional needs, evaluation criteria, and compliance with the regional Transportation Plan and decides whether to place it in the draft TIP for public review and then in the final TIP.

6. Procurement
Following project design and programming of a highway project, the MassDOT Highway Division publishes a request for proposals. It then reviews the bids and awards the contract to the qualified bidder with the lowest bid.

7. Construction
After a construction contract is awarded, MassDOT Highway Division and the contractor develop a public participation plan and a management plan for the construction process.

8. Project Assessment
The purpose of this step is to receive constituents' comments on the project development process and the project's design elements. MassDOT Highway Division can apply what is learned in this process to future projects.

Project Development Schematic Timetable

Description	Schedule Influence	Typical Duration
Step I: Problem/Need/Opportunity Identification The proponent completes a Project Need Form (PNF). This form is then reviewed by the MassDOT District office which provides guidance to the proponent on the subsequent steps of the process.	The Project Need Form has been developed so that it can be prepared quickly by the proponent, including any supporting data that is readily available. The District office shall return comments to the proponent within one month of PNF submission.	1 to 3 months
Step II: Planning Project planning can range from agreement that the problem should be addressed through a clear solution to a detailed analysis of alternatives and their impacts.	For some projects, no planning beyond preparation of the Project Need Form is required. Some projects require a planning study centered on specific project issues associated with the proposed solution or a narrow family of alternatives. More complex projects will likely require a detailed alternatives analysis.	Project Planning Report: 3 to 24+ months
Step III: Project Initiation The proponent prepares and submits a Project Initiation Form (PIF) and a Transportation Evaluation Criteria (TEC) form in this step. The PIF and TEC are informally reviewed by the Metropolitan Planning Organization (MPO) and MassDOT District office, and formally reviewed by the PRC.	The PIF includes refinement of the preliminary information contained in the PNF. Additional information summarizing the results of the planning process, such as the Project Planning Report, are included with the PIF and TEC. The schedule is determined by PRC staff review (dependent on project complexity) and meeting schedule.	1 to 4 months
Step IV: Design, Environmental, and Right of Way The proponent completes the project design. Concurrently, the proponent completes necessary environmental permitting analyses and files applications for permits. Any right of way needed for the project is identified and the acquisition process begins.	The schedule for this step is dependent upon the size of the project and the complexity of the design, permitting, and right-of-way issues. Design review by the MassDOT district and appropriate sections is completed in this step.	3 to 48+ months
Step V: Programming The MPO considers the project in terms of its regional priorities and determines whether or not to include the project in the draft Regional Transportation Improvement Program (TIP) which is then made available for public comment. The TIP includes a project description and funding source.	The schedule for this step is subject to each MPO's programming cycle and meeting schedule. It is also possible that the MPO will not include a project in its Draft TIP based on its review and approval procedures.	3 to 12+ months
Step VI: Procurement The project is advertised for construction and a contract awarded.	Administration of competing projects can influence the advertising schedule.	1 to 12 months
Step VII: Construction The construction process is initiated including public notification and any anticipated public involvement. Construction continues to project completion.	The duration for this step is entirely dependent upon project complexity and phasing.	3 to 60+ months
Step VIII: Project Assessment The construction period is complete and project elements and processes are evaluated on a voluntary basis.	The duration for this step is dependent upon the proponent's approach to this step and any follow-up required.	1 month
